HALLOWEEN WEBINAR

HALLOWEEN WEBINAR

Spooky Smart Halloween Fun with Strawbees & BirdBrain Technologies

Sarah FitzHenry

Erik Thorstensson

@birdbraintech @Strawbees

Outline

- Meet BirdBrain Technologies and the Hummingbird Kit
- Meet Strawbees
- Strawbees + Hummingbird
- Spooky inspiration time 🎃 👻 🕷️
- Lots of free resources!
- Giveaway announcement
- Questions

Link to slides:

What is a robot?

Sense-Think-Act Robot

Sense the environment...

Plan how to react...

Do something!

MEET THE HUMMINGBIRD ROBOTICS KIT

@birdbraintech @Strawbees

BirdBrain Technologies' mission is
to inspire **deep and joyful**
hands-on learning in **all students** .

@birdbraintech

Hummingbird Robotics Kit

Flexible - Creative - Reusable

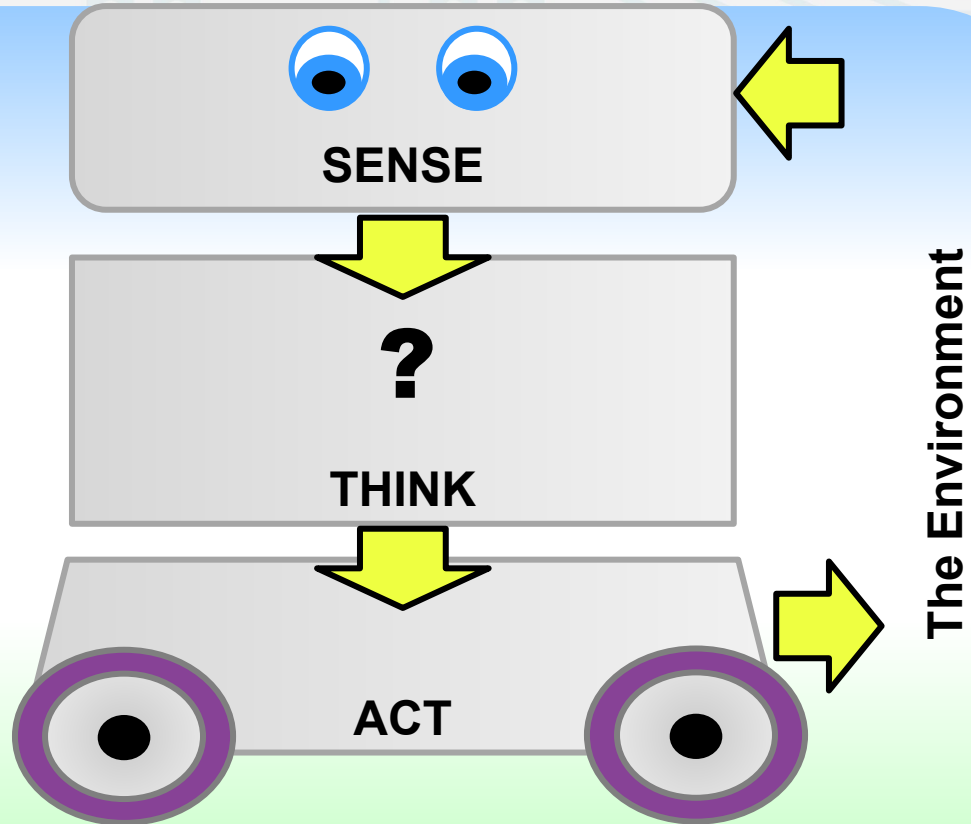

Design, build, and program a personally meaningful robot out of any materials, with any device, in multiple programming languages.

Take a peek inside

Sense-Think-Act Robot

What can you make with the Hummingbird Kit?

Hummingbird Resources

Hey Teachers! Are you the proud new owner of a Hummingbird Kit? You're in the right place!

This guide has everything you need to start teaching. Open up your kit and let's get started!

Start Teaching

Introduction to programming, building, and teaching creative robotics

MAKECODE COURSE

BIRDBLOX COURSE

SNAP! COURSE

Professional Development

Tri-Color LED

Steps 1 2 3 4 5 6 7

This module will show you how to use a tri-color LED with the Hummingbird Bit. A tri-color LED is a small light with four wires. The tri-color LED actually has three tiny lights inside it. One is red, one is green, and one is blue. You can combine different amounts of red, green, and blue light to make different colors.

Please note that there is no sound in these videos.

@birdbraintech @Strawbees

Combining 3D prints, cardboard hacks on birdbraintechologies.com with rails holes and connection points makes for a highly iterative and creative design process.

@birdbraintech @Strawbees

The background of the slide features a light gray, stylized circuit board pattern with various lines, nodes, and square components. A teal-colored rounded rectangle is centered on the slide, containing the text "What questions do you have?".

What questions do you have?

LET'S GET SPOOKY!

@birdbraintech @Strawbees

Shadow Thrower

Sample Code:

SHADOW THROWER

1. Draw a circle on a piece of paper by tracing the end of the cardboard roll. Cut that circle out.

2. Design or trace the shape you would like your shadow thrower to project. Cut the spooky shape out of the center of your circle.
3. Tape a sheet of aluminum foil to the inside of your cardboard roll; lining it completely.

4. Tape your paper circle to one end of your cardboard roll.
5. Insert your single or tri-color LED light through the opposite end of the cardboard roll.

6. Program your LED light.

Take your shadow thrower into a dark room and enjoy!

Wicked Window

WICKED WINDOW

1

Prep your window:

1. Cut a "window" into the lid of your shoebox. Be careful to leave enough of a border that the cardboard does not fall apart.
2. Attach parchment or wax paper to the inside of your box lid so that it covers your whole "window". Set the lid aside.
3. Grab the body of your box. Tape a sheet of aluminum foil to the bottom and sides of your box, lining it completely.
4. Poke two small holes in the bottom of your box. Place one LED light (single or Tri-Color, whatever color you choose) in each hole.

WICKED WINDOW

2

Create your scene:

1. Draw, trace, or print a simple spooky scene on black paper. The scene should be the same size as your "window."
2. Carefully cut out your scene.
3. Flip your scene over. Grab your window lid.
4. Attach your spooky scene to the inside of your window lid via the wrong side. Place the lid, with the scene in place, back onto your box.
5. Program your LED lights to glow or flicker.

Add sensors, sounds, or other spooky effects. Enjoy!

Sample Code:

```
when tapped
repeat forever
  Bit Th-LED 1 Y R 0 % G 0 % B 0 %
  Bit Th-LED 2 Y R 0 % G 0 % B 0 %
  wait pick random 0.5 to 3 secs
  Bit Th-LED 1 Y R 100 % G 100 % B 100 %
  Bit Th-LED 2 Y R 100 % G 100 % B 100 %
  wait 0.1 secs
  Bit Th-LED 1 Y R 0 % G 0 % B 0 %
  Bit Th-LED 2 Y R 0 % G 0 % B 0 %
  wait 0.1 secs
  Bit Th-LED 1 Y R 100 % G 100 % B 100 %
  Bit Th-LED 2 Y R 100 % G 100 % B 100 %
  wait pick random 0.1 to 0.3 secs
```

Jump Scare

JUMPSCARE BUILD

Share your work!
@CodeJoyEdu

Step 1:

- Create the front layer
- Create the "jump out" element

The front layer should be big enough to completely hide the element that "jumps out."

Step 2:

- Attach the "jump out" element to a popsicle stick
- Attach the popsicle stick to the servo horn with hot glue or tape

Step 3:

- Snap on the servo horn with the "jump out" popsicle stick to the motor
- Attach the servo to the back of the front layer near the bottom with hot glue

Why should it be attached near the bottom?
What range of motion should the popsicle stick have?

AI WITH THE HUMMINGBIRD IN SNAP!

In today's world, artificial intelligence and machine learning are constantly in the news, and we are surrounded by devices collecting and using data about us. While the terms artificial intelligence and machine learning are often used interchangeably, they do mean slightly different things. Artificial intelligence refers generally to any system that enables a machine to make a decision, while machine learning refers to systems that use large amounts of data to create models that make predictions. We are focusing on the latter here, so we will use the term machine learning going forward.

These hands-on activities are designed to enable you to create and test your own machine learning models. You will use your models to write programs with the Hummingbird kit so that you can get a better idea of the power of these models when used in software.

Halloween scares

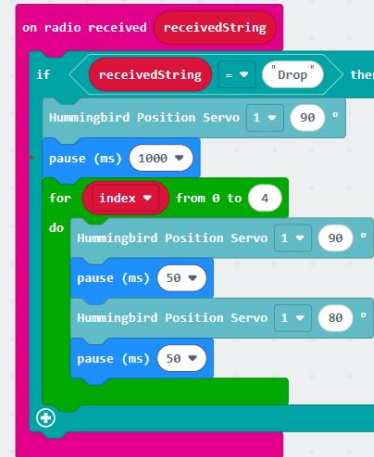

Series of fun Halloween jump scares
built & prototyped using the same basic
code with local and wireless trigger.
Makes prototyping much easier works with
both Robotic inventions and Hummingbird.
